iLoq S10 locking system nominated for International Access Control Product Award

iLoq Ltd. from Finland has been nominated for the 9th Detektor International Awards 2008 in the category "Access Control Product" during international SKYDD 2008 Security exhibition (30.09.-3.10.2008) in Stockholm. The winners of the different awards will be appointed in connexion with Sectech fair in Copenhagen in November 2008. Detektor International is the leading European trade magazine in the field of security technology.

iLoq developed the revolutionary iLoq S10 electronic locking solution which integrates modern mechatronics, communication and software technologies enabling a new level of high-security throughout the lifetime of a locking system. According to Director, Sales & Marketing Michael Szücs "being one of the finalist for the Access Control Product category of this internationally important award confirms that the iLoq S10 locking system is also an excellent solution fulfilling demands of access control applications."

Earlier this year iLoq received the first prize in its series "Physical security product of the year" in the international IFSEC Security Industry 2008 event in Birmingham, UK. The product launch for the Russian market will be during the Hi-Tech Building & House Exhibition that takes place in Moscow Crocus Expo from 30th of October to 1st of November 2008.

The core of the electronically keyed iLoq S10 locking system is the unique self-powered iLoq C10 lock cylinder powered by harvesting electricity from inserting of the key. As no batteries or electric wiring are required, the locks and keys are easy to install and maintain, and it is an environmentally friendly "green" solution. Extremely convenient and flexible system management options break down the limits of traditional key management systems.

As a result – besides an increased security level – unbeatable cost and logistic advantages can be realized in existing and new master-key locking applications for industrial facilities, office, public and rental apartment buildings.

iLoq Ltd develops, manufactures and markets advanced high security electronic locking solutions offering superior keying, maintenance, lifecycle and cost benefits. The revolutionary iLoq locking system enables customers to upgrade security by replacing mechanical locking with digital high-security and to break down keying restrictions whilst saving time, money and the environment.
